

LASER MEASUREMENT SOLUTIONS

IMPROVED PROFILE360 SOFTWARE FEATURES:

Pause and Resume Data Logging – Data logging and alarming can be paused and later resumed via external signal while still viewing real-time profiles in PsViewer. This can prevent start-up scrap data from being logged to your production report.

New Circle Caliper - The circular caliper can be used to measure minimum and maximum diameters, ovality, and circumference of round profiles.

Load New Designs via Modbus TCP or OPC – Now you can change the design file selection via a PLC or host network PC.

Save and Print Snapshots - New buttons have been added so you can immediately save or print snapshots.

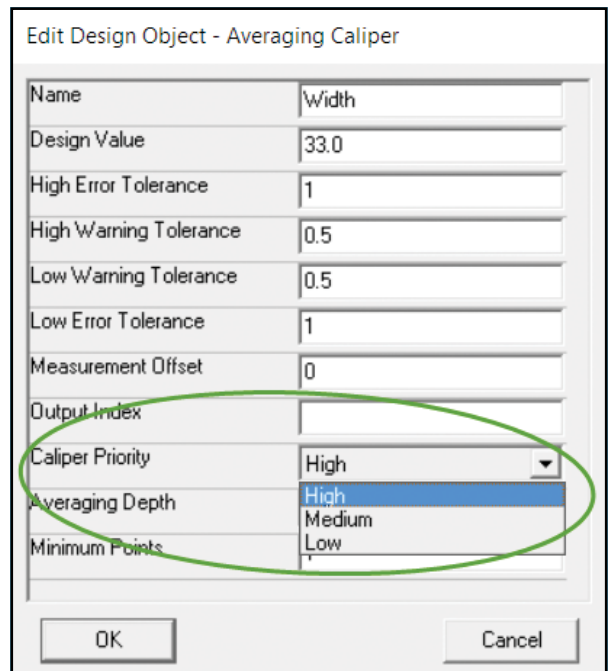

New Offline Mode – Profile360 can now be used to check profiles as an off-line station that can be incorporated into any work-cell, just like an optical comparator.

New Caliper Prioritization - This setting enables you to take one action on high priority calipers and another action on low priority calipers.

1. Field-of-view (FoV) is defined as the nominal measurement range of the system - 25mm, 50mm, 75mm, 100mm, and 175mm.
2. Requires purchase of optional SPC Module
3. Requires purchase of optional Alarm Notification Module
4. Requires purchase of optional Reporting Module
