

Understanding Startup Behavior Using Profile360

Starrett-Bytewise...leading the way with on-line profile inspection for rubber extrusions

Startup of a new run generates a substantial amount of scrap, and reduces the line yield. Profile360 users have employed the instrument to reduce the startup time through a better understanding of startup behavior. By observing the real-time optical comparator the user can immediately see the dimensional result of process and equipment set point changes. The example below illustrates how 4 different dimensions come into specification at different points in time. Some Profile360 users who have focused on minimizing startup time claims reductions around 50%.
